

# SALVANA K<sup>PLUS</sup>

## Complementary feed balancing natural deficiencies of whole milk

Whole milk is rich in nutrients, but poor in essential micronutrients. Additionally, high amounts of butterfat in whole milk may exceed the digestive capacity of the young calf and cause indigestions. This makes an additional supply of vitamins, trace elements and digestibility enhancers essential for successful calf rearing.

**Salvana K<sup>PLUS</sup>** is a tailor-made product to level natural deficiencies of whole milk. It improves calf performance and health, which means more cost effective growth.

**Glycine chelated trace elements** compensate for deficiencies of whole milk feeding

**Vitamins and  $\beta$ -Carotene** strengthen the body own resistance

**Emulsifier** supporting digestion of butterfat

**Probiotic bacteria and acid complex** form a protective barrier with the intestinal mucosa and stabilize gut function

**Salvana K<sup>PLUS</sup>** is making whole milk a wholesome meal. An early application, from the second meal on, will help to reduce the risk of calf losses significantly.

### Feeding recommendation:

**Salvana K<sup>PLUS</sup>** is mixed into whole milk with 15 g per litre –

feed at least 100 g per calf and day.

The daily amount of milk should be portioned into at least two meals. Increasing amounts and high milk quantities ( $\geq 8$  litres daily) should be divided into at least three meals per day (max. 4 litres per meal).

**SALVANA K<sup>PLUS</sup> -  
making whole milk a wholesome meal!**

Package: 10 kg or 25 kg bag
