

SALVACID M

Acidifying supplement for milk and milk replacer

In young calves, high growth rates can only be achieved with intensive milk feeding. High quantities of milk per single meal may overload the digestive capacity of the abomasum. Very often ad libitum feeding of calf is associated with an intensive microbial growth, when milk or milk replacer is not preserved during prolonged feeding intervals. In both cases digestive problem or diarrhoea may arise in calf. **SALVACID M** contains a reliable acid combination to overcome these problems.

-  Acid combination with double action:
pH-drop and special bactericide impact
-  Reliable preserving of milk and milk replacer
-  Flexible handling with cold and warm milk
-  Safe and simple handling

SALVACID M is a complementary feed acidifying colostrum (from 2. meal), milk replacer or whole milk for calf. Risk of diarrhoea will be considerably reduced when fed from second meal on.

It is recommended to supplement whole milk with **SALVANA K** in order to prevent trace element or vitamin deficiency.

Feeding recommendation:

Warm acid milk and free access up to 12 h: 5 grams per litre milk or replacer.

A plain measuring cup: 20 grams cover 4 litre milk or replacer.

Cold acid milk and free access for more than 12 hours: 10 grams per litre milk or replacer.

A plain measuring cup: 20 grams cover 2 litre milk or replacer.

SALVACID M -
reliable preservation to cover first growth of calf!

Package: 10 kg bucket
